財務分析

中英雙語完整筆記 / Complete Bilingual Notes

運用會計比率評估企業的盈利能力、流動性及營運效率。

財務分析

Financial Analysis

掌握主要會計比率的計算、解讀及比較方法，並能評估企業的盈利能力、流動性、償債能力、管理效率及投資回報。

Master the calculation, interpretation and comparison of key accounting ratios, and evaluate profitability, liquidity, solvency, management efficiency and return on investment.

財務分析的用途與步驟 Purpose and Process of Financial Analysis

財務分析把財務報表數字轉化為有意義的比率，協助使用者判斷企業的財務表現、財務狀況及未來風險。

Financial analysis turns financial-statement figures into meaningful ratios to help users assess financial performance, financial position and future risk.

分析時應先計算相關比率，再與過往年度、預算、行業平均或其他企業比較，最後結合業務背景解釋原因。

Analysis should calculate relevant ratios, compare them with previous years, budgets, industry averages or other firms, and then explain causes using business context.

單一比率通常不足以作出結論。例如淨利率上升可能來自售價提高、成本控制或一次性收入，須配合其他比率和題目資料判斷。

A single ratio is usually insufficient for a conclusion. For example, a higher net profit ratio may result from higher prices, cost control or one-off income, so other ratios and case information are needed.

盈利能力比率 Profitability Ratios

毛利率 = 毛利 / 銷貨淨額 × 100%。毛利率反映銷售收入扣除銷貨成本後留下多少毛利，受售價、採購成本、折扣及存貨計價影響。

Gross profit ratio = gross profit / net sales × 100%. It shows how much gross profit remains after cost of goods sold, and is affected by selling prices, purchase costs, discounts and inventory valuation.

成本加成率 = 毛利 / 銷貨成本 × 100%。它從成本角度量度定價幅度，須與毛利率分清；毛利率以銷售額為分母，成本加成率以銷貨成本為分母。

Mark-up = gross profit / cost of goods sold × 100%. It measures pricing from a cost perspective; distinguish it from gross profit ratio, which uses sales as denominator while mark-up uses cost of goods sold.

淨利率 = 淨利潤 / 銷貨淨額 × 100%。淨利率反映扣除營運費用後每一元銷售帶來的淨利，常用來分析費用控制及整體盈利能力。

Net profit ratio = net profit / net sales × 100%. It shows net profit earned from each dollar of sales after operating expenses, and is useful for assessing expense control and overall profitability.

資本運用回報率 = 利息及稅前淨利潤 / 資本運用 × 100%。資本運用通常等於權益加非流動負債，或總資產減流動負債；題目若有指定應跟從指定口徑。

Return on capital employed = net profit before interest and tax / capital employed × 100%. Capital employed is usually equity plus non-current liabilities, or total assets less current liabilities; follow the question if a basis is specified.

流動性比率 Liquidity Ratios

流動比率 = 流動資產 / 流動負債。它量度企業以短期資產償還短期負債的能力，但過高可能代表資金閒置、存貨過多或應收帳款回收慢。

Current ratio = current assets / current liabilities. It measures the ability to repay short-term liabilities using short-term assets, but an excessively high ratio may indicate idle funds, excessive inventory or slow receivables collection.

速動比率 = (流動資產 - 存貨) / 流動負債。它排除較難即時變現的存貨，更嚴格地評估短期償債能力；若題目列明預付款等不可即時變現項目，亦應按題意處理。

Quick ratio = (current assets - inventory) / current liabilities. It excludes inventory, which may be less readily convertible into cash, and gives a stricter liquidity test; if the question identifies prepayments or other non-liquid items, treat them as instructed.

應收貨款週轉率 = 除銷額 / 平均應收貨款；平均收帳期 = 平均應收貨款 / 除銷額 x 365 日。收帳期越短，通常代表收款效率越高，但過嚴信貸政策可能影響銷售。	Trade receivables turnover = credit sales / average trade receivables; average collection period = average trade receivables / credit sales x 365 days. A shorter period usually means better collection, but overly strict credit policy may reduce sales.
應付貨款週轉率 = 除購額 / 平均應付貨款；平均還款期 = 平均應付貨款 / 除購額 x 365 日。還款期較長可改善現金流，但過長可能損害供應商關係及信用。	Trade payables turnover = credit purchases / average trade payables; average repayment period = average trade payables / credit purchases x 365 days. A longer period may improve cash flow, but too long may damage supplier relationships and credit standing.
存貨週轉率 = 銷貨成本 / 平均存貨；存貨週轉期 = 平均存貨 / 銷貨成本 x 365 日。存貨週轉快通常代表存貨管理較有效，但過低存貨亦可能引致缺貨。	Inventory turnover = cost of goods sold / average inventory; inventory turnover period = average inventory / cost of goods sold x 365 days. Faster turnover often indicates effective inventory management, but too little inventory may cause stock-outs.

償債能力與管理效率 Solvency and Management Efficiency

償債能力關注企業長期履行財務責任的能力。負債比率或資本負債比率上升，代表企業較依賴借貸融資，財務風險及利息負擔通常較高。	Solvency concerns a firm's long-term ability to meet financial obligations. A higher gearing ratio indicates greater reliance on debt financing and usually higher financial risk and interest burden.
常用資本負債比率 = 非流動負債 / 資本運用 x 100%。若題目指定以總負債、權益或其他公式計算，應採用題目定義並在答案中保持一致。	A common gearing ratio is non-current liabilities / capital employed x 100%. If the question defines it using total liabilities, equity or another basis, use that definition consistently in the answer.
總資產週轉率 = 銷貨淨額 / 總資產或平均總資產。比率越高，通常代表企業運用資產產生銷售的效率越高；但仍須考慮資產新舊、行業模式及租賃或外判安排。	Total assets turnover = net sales / total assets or average total assets. A higher ratio normally indicates more efficient use of assets to generate sales, but asset age, industry model, leasing and outsourcing should also be considered.
應收貨款、應付貨款及存貨週轉也可用於管理效率分析，因為它們反映營運資金循環是否順暢。	Receivables, payables and inventory turnover can also be used in management-efficiency analysis because they show whether the working-capital cycle is operating smoothly.

投資回報比率 Return on Investment Ratios

每股盈利 = 普通股股東應佔利潤 / 已發行普通股股數。它量度每股普通股所賺取的利潤，是分析股東回報的重要資料。	Earnings per share = profit attributable to ordinary shareholders / number of ordinary shares issued. It measures profit earned per ordinary share and is important for analysing shareholder return.
股息保障倍數 = 每股盈利 / 每股股息，或普通股股東應佔利潤 / 普通股股息。倍數越高，代表盈利對股息的保障越強，但亦可能表示公司保留較多盈利而派息較少。	Dividend cover = earnings per share / dividend per share, or profit attributable to ordinary shareholders / ordinary dividends. A higher cover means dividends are better supported by earnings, but may also indicate more profit retained and lower distribution.
市盈率 = 每股市價 / 每股盈利。市盈率較高可能反映投資者預期增長較高，但亦可能代表股價偏高或盈利暫時偏低。	Price-earnings ratio = market price per share / earnings per share. A higher P/E ratio may reflect stronger growth expectations, but may also indicate an overvalued share price or temporarily low earnings.
投資回報比率應與公司風險、行業前景、股息政策及非財務因素一併分析，不能只根據一個比率作投資決定。	Return-on-investment ratios should be analysed together with company risk, industry prospects, dividend policy and non-financial factors; investment decisions should not rely on one ratio alone.

比率分析的功能與限制 Functions and Limitations of Ratio Analysis

比率分析可簡化大量會計資料，協助比較不同期間、不同企業及不同管理策略的成效，並支持貸款、投資及營運決策。	Ratio analysis simplifies large amounts of accounting information, supports comparison across periods, firms and strategies, and assists lending, investment and operating decisions.
--	---

比率受會計政策、估計、通脹、季節性、一次性交易及企業規模影響；不同企業若採用不同存貨計價或折舊方法，直接比較可能不公平。	Ratios are affected by accounting policies, estimates, inflation, seasonality, one-off transactions and business size; comparisons may be unfair if firms use different inventory valuation or depreciation methods.
比率主要依賴歷史財務資料，未必反映品牌、員工質素、管理能力、競爭環境及未來市場變化等非財務因素。	Ratios mainly rely on historical financial information and may not reflect non-financial factors such as brand, staff quality, management ability, competition and future market changes.
高分答案應先指出比率變動，再引用題目數據解釋原因，最後給出平衡結論或建議；避免只寫「高較好、低較差」。	A strong answer states the ratio movement, explains causes using case data, and gives a balanced conclusion or recommendation; avoid simply saying “higher is better” or “lower is worse”.

關鍵詞彙 Key Terms

財務分析 Financial analysis

運用財務報表及比率評估企業表現、狀況及風險的過程。

The process of using financial statements and ratios to assess performance, position and risk.

盈利能力 Profitability

企業賺取利潤及控制成本的能力。

The ability of a business to earn profit and control costs.

成本加成率 Mark-up

毛利佔銷貨成本的百分比。

Gross profit expressed as a percentage of cost of goods sold.

資本運用回報率 Return on capital employed

量度企業運用長期資本賺取利潤的效率。

A measure of how efficiently a business earns profit from long-term capital employed.

流動比率 Current ratio

流動資產相對流動負債的比例。

The ratio of current assets to current liabilities.

應收貨款週轉率 Trade receivables turnover

除銷額相對平均應收貨款的倍數。

Credit sales relative to average trade receivables.

應付貨款週轉率 Trade payables turnover

除購額相對平均應付貨款的倍數。

Credit purchases relative to average trade payables.

存貨週轉率 Inventory turnover

銷貨成本相對平均存貨的倍數。

Cost of goods sold relative to average inventory.

會計比率 Accounting ratio

把兩個相關會計數字連繫起來以作比較及解釋的指標。

A measure linking two related accounting figures for comparison and interpretation.

毛利率 Gross profit ratio

毛利佔銷貨淨額的百分比。

Gross profit expressed as a percentage of net sales.

淨利率 Net profit ratio

淨利潤佔銷貨淨額的百分比。

Net profit expressed as a percentage of net sales.

流動性 Liquidity

企業以流動資產償還短期債務的能力。

The ability of a business to pay short-term debts using current assets.

速動比率 Quick ratio / Acid test ratio

扣除存貨後流動資產相對流動負債的比例。

The ratio of current assets excluding inventory to current liabilities.

平均收帳期 Average trade receivables collection period

企業平均需要多少日收回應收貨款。

The average number of days taken to collect trade receivables.

平均還款期 Average trade payables repayment period

企業平均需要多少日支付應付貨款。

The average number of days taken to pay trade payables.

償債能力 Solvency

企業長期償還債務及持續經營的能力。

The long-term ability of a business to repay debts and continue operations.

資本負債比率 Gearing ratio

量度企業依賴借貸資本程度的比率。

A ratio measuring the extent to which a business relies on debt capital.

管理效率 Management efficiency

管理層運用資產及營運資金創造銷售或利潤的效率。

The efficiency with which management uses assets and working capital to generate sales or profit.

總資產週轉率 Total assets turnover

銷貨淨額相對總資產或平均總資產的倍數。

Net sales relative to total assets or average total assets.

每股盈利 Earnings per share

每一股普通股應佔的利潤。

Profit attributable to each ordinary share.

股息保障倍數 Dividend cover

盈利可覆蓋普通股股息的倍數。

The number of times earnings can cover ordinary dividends.

市盈率 Price-earnings ratio

每股市價相對每股盈利的倍數。

Market price per share relative to earnings per share.

DSE 作答提示 Exam Tips

比率題不要只計算。答案應包括公式、代入、結果、趨勢比較、原因及結論，並引用題目資料支持判斷。

Do not only calculate ratios. Include formula, substitution, result, trend comparison, reasons and conclusion, supported by case data.

分清毛利率與成本加成率：前者分母是銷貨淨額，後者分母是銷貨成本；兩者不可混用。

Distinguish gross profit ratio from mark-up: the former uses net sales as denominator, while the latter uses cost of goods sold.

若題目沒有平均數，可按題目可得資料用期末數；若提供期初及期末數，週轉類比率通常應用平均數。

If no average figure is available, use the period-end figure given; if opening and closing balances are provided, turnover ratios normally use averages.

解釋比率時要避免絕對化。流動比率過低有償債風險，但過高也可能反映資金運用效率低。

Avoid absolute judgments. A low current ratio may signal liquidity risk, but an excessively high ratio may indicate inefficient use of funds.

快速自測與答案 Quick Check and Answers**Q1. 毛利率下降但銷售額上升，可能代表甚麼？**

What may it mean if gross profit ratio falls while sales increase?

答案：可能代表減價促銷、採購成本上升、銷售組合轉向低毛利產品，或存貨成本控制轉差。須結合費用及其他比率判斷整體盈利能力。

Answer: It may indicate price reductions, higher purchase costs, a shift to lower-margin products or weaker inventory cost control. Overall profitability should be judged with expenses and other ratios.

Q2. 為何速動比率通常比流動比率更嚴格？

Why is the quick ratio usually a stricter test than the current ratio?

答案：速動比率排除存貨，因為存貨未必能快速按帳面值變現，所以更集中量度即時還款能力。

Answer: The quick ratio excludes inventory because it may not be quickly converted into cash at book value, so it focuses more on immediate repayment ability.

Q3. 平均收帳期延長會帶來甚麼利弊？

What are the possible advantages and disadvantages of a longer average collection period?

答案：較寬鬆信貸可能增加銷售，但也會令現金回收變慢、壞帳風險上升，並增加營運資金壓力。

Answer: Looser credit may increase sales, but it slows cash collection, increases bad-debt risk and puts pressure on working capital.

Q4. 資本負債比率上升是否一定代表企業變差？

Does a higher gearing ratio always mean the business is worse?

答案：不一定。借貸可支持擴張並提高股東回報，但會增加利息負擔和財務風險；須看盈利穩定性、利率及資金用途。

Answer: Not necessarily. Debt can support expansion and improve shareholder return, but it increases interest burden and financial risk; profitability stability, interest rates and use of funds must be considered.

Q5. 市盈率較高可以如何解讀？

How can a higher price-earnings ratio be interpreted?

答案：可能表示市場預期公司增長較好，也可能表示股價偏高或當期盈利偏低。投資分析須同時考慮風險及非財務資料。

Answer: It may show higher expected growth, but may also mean the share price is high or current earnings are low. Investment analysis should also consider risk and non-financial information.
